This statement from your original post looks like your problem.

"I have enabled object access via the default domain controllers policy and have set auditing on a particular object in Active Directory however I never see anything in the security logs when I try to test by changing, deleting or modifying files."

The default domain controllers policy applies to domain controllers. You'll need to configure a policy on an OU which contain the servers which you want to audit. You could, edit the Default Domain Policy for this, but I suggest you do it on an OU which contain your servers. Call it "Member Servers".

Yes I have that document in hand. I am just trying to get this up an running I am trying to audit folders for success/failure and I am looking at the security log in event viewer. The folder has auditing set but when tested by deleting test folders and creating text files etc nothing shows up in event viewer.
