have a registry key on my Windows 2000 Server that appears to be corrupted and cannot be removed. It appears as greyed out when looking through regedt32 and I cannot modify the permissions to the key or remove it or modify it. I also cannot delete it if I delete the parent key.

I have tried starting regedt32 in the system context by using the at command and this still does not allow me to do anything with the key.

I need to get rid of this registry key, does anyone have any suggestions on how to do this?

Thanks

Jody
