Hi,

Can anyone help me how to do?

we are running Windows 2003 AD with 80 workstations.

A new network printer is added and shared in a print server. It's already published in the AD.

If i want this new printer attached automatically in all workstation as default printer, how to make it easier? Otherwise, i will need to do it in every users workstation in manually.

I may send a link to the users and let them do it themselves. but, some of them are not smart enough.

I want this printer will be the new default after they logged off and logged on again.

I know logon script "net use" can mapped it as lpt but i don't want to do like that.

I tried the following by Microsoft as well but it's to add the local printer manually.

<http://support.microsoft.com/kb/314486/en-us>

anyone can help?

Many thanks

ddt

.
