I am running Windows 2003 Enterprise edition with Terminal Services.

When user logs in to the terminal services using remote desktop then internet explorer – the internet works fine. Problem is, javascript's are not working. Any page that is using javascripts (not Java) do not work.

However, if I log in to the terminal services using the administrator logon, internet explorer works fine.

All of my updates are up to date and I am using IE 6.0 SP1.

Since the administrator works fine but other users do not, I am sure it's just a security setting somewhere in maybe the Group Policy Editor or in Active Directory Group settings, but I can not find anything that would relate to this.

Help please!

Jason
