Hello,

I have a home office and I am looking for a fax modem (internal) to put in my Server 2003 system. I was wondering if someone can give me some suggestions that are compatible.

These are the functions I need:

- 1) Be able to share it out so that other computers in the domain can send faxes though it.
- 2) Ideally, when a fax is received have the in coming fax sent into the correct persons "My fax" or at least into a central share so that I can manually put the fax into a folder accessible my the right person.
- 3) Have Caller ID and call waiting ID (and support the usual voice functions that my landline needs)
- 4) Since this is going to be a shared line. I want to plug the voice phone line in the the phone port on the modem and the modem deal with the switching. If it's a voice call send to phone if it's a fax deal with it.
- 5) Be able to enable/disable send and/or receive as needed.
- 6) INEXPENSIVE!!!

Thank you,

TC
