You can host sites on any version of WinServer 2003.

You can also install Apache and use it to host your sites if you do not want to use IIS.

I'm sure you can find people over here to hire to assist you in setting it up. :)

Thank you for the response. I am actually trying to figure things out that I should have figured out before I bought the product along the lines of "is this really what I need and want?" If I understood the salesman right I can use this on a private network to host our website in development. I just need to know if I should be looking for third party software such as apache or is server 2003 a stand alone? I think I will be going down to get a book though because the more I look into this the more complex it looks.

Thanks again for the help

Do you need assistance on how to setup a Windows 2003 server? If so I would highly recommend picking up some books at a local book store or maybe

Re: 2003 server for website development

even

hire a local IT company to install/setup your network. If it's just one certain service or function of Server you need help with please be more specific.

Good luck to you,

Hi if this is not the right place please redirect me. I just bought server 2003 and am going to put it on an older computer we have so I can develop our website before posting (after that I will be using for database stuff) Can anyone point me in the right direction to getting the computers working together and having everything set up right. Any help will be greatly appreciated.
