Booting into Safe Mode is unlikely to get you anywhere.

What is the response you get when you run these commands from a Command Prompt:

```
net use X: \\YourServer\c$
net use Y: \\YourServer\d$
net use Z: \\YourServer\e$
```

When trying to connect to \\servername\c\$ i get connection can't be made. Reason most likely cause c by default isn't being shared. The network registry can't be accessed due it i telling me the service isn't enabled. Booting the server in safe mode may allow login?

I can't tell. When you write "I actually had already tried to get to c\$ drive over the network that didn't work" you need to be a lot more specific. Take off your user's hat and put on your administrator's hat, by writing precisely WHAT YOU DO to make the connection and WHAT YOU SEE when it does not work. We can't see your screen, only you can!

I actually had already tried to get to c\$ drive over the network that

didn't

Re: CAN'T LOGIN!! (urgent)

work. I also tried to do a remote connect through the regedit
and that

was

a
