Ok, i'm trying to do something that seems simple, but i just can't get it.

I'm trying to create a share on our W2k3 network. By default, I want no
one

to be able to add / modify files. I want to be able to give out WHO can
add

/change files at different subfolders.

so lets say I have this NTFS Folder structure:

```
c:\myrootshare  
c:\myrootshare\NYOffice  
c:\myrootshare\NYOffice\Marketing  
c:\myrootshare\NYOffice\Sales
```

I create a NETWORK share pointing to c:\myrootshare with Everyone Full Control.

I'd like to make it so that no one can add files anywhere. but to have subfolders be administered by a department head. (so the Marketing guy can control what files get published and controls who can have access).

but with the c:\myrootshare\NYOffice\Sales I want a specific user to be
able

to add/edit files.

So the gist of what i'm trying to do is create a network share and CONTROL who can place files in specific folders via NTFS permissions. I'm trying

Re: Need Help RE: NTFS

to

avoid all users just dumping up their junk on the network share.

if I set c:\myrootshare to EVERYONE read only, then then on a subfolder

give

FULL CONTROL to a specific user, they ultimately seem to get READ ONLY permissions.

does anyone have any advice or guidance?

thank you.

You write

=====

if I set c:\myrootshare to EVERYONE read only, then then on a subfolder give FULL CONTROL to a specific user, THEY ultimately seem to get READ ONLY permissions.

=====

Your question is unclear. Who gets read-only permission: they (i.e. everyone), or he (the specific user)?
