One domain, but how many domain controllers? and how many are DNS servers?

Do the dynamic updates on all the DNS servers match? ie secure updates or non secure?

Do you have any other errors in the event viewer of this machine under FRS?

Please post all error messages here please

I did go to the article and tried this To work around this behavior, specify a different Windows 2000-based Active Directory-integrated DNS server on the DNS tab in the Advanced TCP/IP Settings dialog box. but didn't understand

"Harj" wrote:

How many domain controllers do you have in the network?

Are all of them showing this error?

Where are these DC's pointed for DNS? And what kind of DNS servers are these?

Could you please run netdiag /v and post it up here from this machine.

Check out the following article which may help you.

How do I clean these errors up? I am a newbie. Running W2003 Std. Srvr.

NTDS (980) NTDSA: Index DRA_USN_index of table

Re: Event Log Issues

datatable is corrupted (0).

The DNS server was unable to add or write an update of domain name server in zone IonianDevelopment.local to the Active Directory. Check that the Active Directory is functioning properly and add or update this domain name using the DNS console. The extended error debug information (which may be empty) is "000020EF: SvcErr: DSID-02080490, problem 5012 (DIR_ERROR), data -1414". The event data contains the error.
