I have the same need and cannot get this to work. What do you mean when you say:

If your company has a public Wifi, then setup a server with printer connected to it and ask them to print to:
\\servername\printer

The only way I can get the printer added at all is to go to run and type in \\server, which prompts me to authenticate to the domain. If I enter a domain credentials, I can add the printer but it is disconnected the next time I reboot. When trying to go through the Add Printer, wizard, I can see the print server when I browse, but I cannot open it up to see the printers.

What am I doing wrong here.

Jabez Gan [MVP] wrote:

Print server as in...? You want your visitors to connect to the print server hardware using a cable before they can print or they can print directly through a public wifi in your company?

If your company has a public Wifi, then setup a server with printer connected to it and ask them to print to:

\\servername\printer
