Hi Guys,

Any luck? I am having the same issue. At first we thought it was an image we where deploying, but its random. Some of my clients get this problem. Some do not. Reinstalling from scratch does solve it. Odd!!

John wrote:

You mentioned in your post that you would monitor the situation after turning off Automatic Updated. Was wondering if it had the desired effect. I have the exact symptoms as your post and a WSUS server that pushes out updates. So, any new news on this one? I've been working with MS for days on this and they haven't resolved yet.

Thanks,
John

"Modci" wrote:

Did you find a resolution outside of just disabling Automatic Updates? For now, I have disabled the automatic updates on the two servers to see if there is a positive effect. I will monitor. But obviously the solution should not be limited to never performing auto updates anymore.

This is interesting, and thanks for your post.

You are not alone. We traced our problem back to Automatic Updates.
IF we turn off the automatic updates (to our own WSUS

Re: Services Stopping Unexpectedly – again, and again, and again

server), then
the other services don't stop. This is happening on 3 of our
servers.
All of them were built by ADS, and an additional 5 of them
from the
exact same image (total 8 new servers) and only 3 are having
this
problem. We have seen it with both Standard and Enterprise
edition.

Mike

No, but I appreciate your situation. I will
certainly post the resolution
when I find it. This effects 2 of our servers
as well (the only 2 we have,
both DCs).

Another oddity is I keep seeing seeing is
svchost.exe process errors.

Modci,

we have just started haveing
the smae problems on 2
servers, have you
found a solution to this
issue?

this is very disruptive.

Any ideas

Thanks Stuart

Re: Services Stopping Unexpectedly – again, and again, and again

server.

For about a week now I have several services that are normally started automatically are stopping intermitently.

When these services stop (IE Workstation) all my users lose access to everything outside of their local machine (printers, network drives, etc. – basically everything the workstation is there to support).

I've reviewed the event logs and the primary event that is logged when users lose their network connections is the following:

Source:
Service
Control
Manager
Event ID:

Re: Services Stopping Unexpectedly – again, and again, and again

7032

Description:

The Service Control Manager tried to take a corrective action (Restart the service) after the unexpected termination of the Windows Management Instrumentation service, but this action failed with the following error:
An instance of the service is already running.

–end

This message is recorded in the event viewer, but I also notice other services have stopped that isn't always recorded in the event viewer. These services include the following (not limited to): Routing

Re: Services Stopping Unexpectedly – again, and again, and again

and REmote
Access,
Secondary
Logon,
Task
Scheduler,
Windows
Audio,
Wireless
Configuration,
Workstation,
Automatic
Updates,
Cryptographic
Services,
Computer
Browser,
Help and
Support.

Again, this
happens
intermittently.
In addition,
each service
I mentioned
is set to
Startup
Automatically.
Rebooting
the server
does not
resolve the
issue. Each
time this
happens, I
must restart
the
workstation
service
(primarily
to get folder
redirection
back for
users
accessing
'My
documents.'

Thank you
in advance

Re: Services Stopping Unexpectedly – again, and again, and again

for your
help.

This is very
weird.
