It sounds as though you have a Group Policy operating that is controlling the User Rights. Someone must have added the policy to AD for this to start happening.

As it happens, one of the MS security templates does this, so maybe, just speculatively, someone has applied this template.

To test this, make sure in AD that no policies are being applied, and amend the local policy manually. However, you need to be very sure that you have the correct security settings afterwards and not just open it up to get it to work.

Also make sure also that full security auditing is turned on, and see where it is failing.

hi --today websites on our server started throwing 401.1 Not Authorized error. We checked several things but no help. Finally found that network users are denied access on the system (since IIS anonymous users access sites via network rights). Using "Local Security Settings" MMC we navigate to Local Policies > User Right Assignment. Double click on "Access this computer from network" and add "Everyone" to it. When this is done, sites start to work properly. After few minutes sites again stop, when we check local security setting our settings are vanished and "Access this computer from network" is blank!

This problem is driving us nuts beside costing business since client's sites are down. We checked server, there is not virus etc. Any help is appreciated, we are will to pay for help.

Thank you!
Aziz
