Let's begin straight off with this: you can add the fac member's domain account to the local administrators group on her workstation without making her a Domain Admin. The former proffers admin rights to a single workstation, the latter to your entire domain. I would sooner set my hair on fire than make a user a DA to address a local application problem; it's a horrific idea and one that should not have been implemented even as a temporary workaround.

To troubleshoot the individual application issues, you can use filemon and regmon to determine which files and registry keys the user is unable to access as a Standard User. These tools are available as a free download here: <http://www.microsoft.com/technet/sysinternals/default.mspx>

This solution worked like a champ! Thank you.
