We have a webserver that crashed a while back and now our sites display a warning to everyone who access our https sites. i've looked in our MS CA and it shows the server having two Certs issued the same day which is the day it was recovered from the crash. The warning people receive is a warning about the server name not matching the certificate. How do i fix this? do i revoke both certs? can i revoke the one created earlier in the day? i just am not totally familiar with this CA so i'm not sure what to do.....
