I have a strange problem with one of our servers where it was giving me the "Enter your credentials" message repeatedly when logged on as administrator. I could not change the password using CTRL-ALT-DEL since I was getting the Incorrect Password message, even though I just changed it!

If I change the password using another admin account or the "net user administrator newpassword" command, I can log in only once with that password, after that I get the incorrect password deal all over again!!!

Is there a way to "refresh" the admin account or clear up whatever is mucked up, or am I missing something?

This server is the only DC on the domain and has antivirus and backup software running on it. I just patched it with SP2 and the problem persists.

Thanks in advance..

Ray!
