Hi All

I have a w2k3 server sp1 with around 20 xp pro sp2 clients. All the clients point to the server for dns. The problem I have is that they don't seem to be registering when booted up and logged in. In total only 4 add their names and addresses to dns and the rest don't. They all seem to be setup with the correct box ticked in the pc's dns setting yet all seem to be able to surf ok

Can anyone point me in the right direction

Cheers

Glenn
