- 

hi,

I am beginner in the field of Networking, I am trying to convert my organization setup from Workgroup to Domain. For this i have done the followings,

- 1) Installed Windows 2003 server on a machine
  - 2) Installed AD (create domain www.abc.com)
  - 3) Create OU (for each dept like I.T, HR etc)
  - 4) Create two groups (Admin and Staff)
  - 5) Add users in OU and relate them to a group. (users are also member of "Users")
- \*Note every thing is going with default settings.
- 6) Start adding user PCs on domain (users have Windows XP installed)

Here i am facing some problems,

- 1) Users previously sharing their printer are not able to share it now.
- 2) Some users are facing problem to write data on their local drives.

Would you please suggest me what to do ?

Waiting....

.
