So I am assuming your server is running RRAS? Have you gone in and checked that it is still installed and working?

Can your workstations ping the default gateway of the server (i.e. 192.168.1.1) or even the Internet NIC of the server (i.e. 192.168.1.2).

news:2A27BA99-E42B-432F-9659-CAA059FAACBE@xxxxxxxxxxxxxxxxxxxx

I have a Server 2003 with 2 network cards:
Card 1: (physically connect to internal LAN)
IP address 192.168.0.1
subnet mask 255.255.255.0
Card 2: (physically connect to the router of Internet Service Provider)
IP address 192.168.1.2
subnet mask 255.255.255.0
default gateway 192.168.1.1
dns server 203.198.23.108

The workstations on the internal LAN can go to the internet. I would like to install the Windows SharePoint Services 3.0, so I follow the pre-installation steps as follow:

1. install ASP.NET framework 3.0
2. run Configure Your Server Wizard to install IIS
3. open IIS Manager and want to enable ASP.NET 2.0, however I cannot find the ASP.NET 2.0 on the Web Server Extensions (the ASP.NET 2.0 framework had already installed before)
4. run Configure Your Server Wizard again to remove the IIS

After all, I find that the server can still go to internet, but all the workstations cannot.

Sorry for the long story. How can I fix it?
Thanks.
Joe.
