One thing to note however is that users are REMOTELY scheduling tasks (over the network).

Where is "Run as Batch"?  
... I don't see it as a group.

It is not — it is a Right. But you might create such a Group, give the right, and make it easy to give the right by adding someone to the group (if you don't already have users in a large number of groups.)

Check RIGHTS not groups.

I'm also trying to do this...

It seems that in order to CREATE a task, one must be an

Re: Running Scheduled Tasks Remotely Without Full Administrator Ri

administrator.

I also cannot find any way to allow a user to CREATE a task without being an administrator.

What if you give the user "Run as Batch" right explicitly?

This should work to Schedule and RUN the task locally (in the Task Scheduler)

but the user may need more privilege depending on what the task actually does.

See this post for details:

I'm trying to setup a user to be able to run a scheduled task on a remote server using the following command:

```
schtasks /run /s MyServer  
/TN MyTask
```

Of course, this works fine if I make the user a local administrator on the server hosting the scheduled task. But...I don't want this user to

Re: Running Scheduled Tasks Remotely Without Full Administrator Ri

have full administrator rights on the server.

I gave the user read/execute permissions on the security tab for the task itself. I've also given the user "Log on as a batch job" permissions in the local security policy, but I am still getting an "ERROR: Access is denied." message.

As a work around I also tried giving a test user RDP access to the server to see if that would do the trick, but I get an "Access is denied" message when I click on the Scheduled Tasks icon in the control panel.

Anyone have any ideas on this one?
