Does this application require a mapped drive and do you use login scripts that map network drives when a user logs onto the domain?

"Postilion" <marktype@xxxxxxxx> wrote in message  
<news:1179522106.665955.97930@xx>

I setup a new Citrix Server but a certain published application is not working when users connect through MetaFrame Presentation Server Web Client. The error the application receives mirrors what would happen if the network mapped drive was not available.

The published application is on another Citrix server and works fine and it is setup the exact same way in terms of configuration. The MetaFrame client is allowed to access the users drive with "Full Access" so that is not part of the issue. Could it be a timing issue somewhere? BTW, if the user signs onto the server through plain terminal services it works fine under their profile.

The logon script does not appear to run as quickly on the troubled server when the user logs onto Citrix and connects to the application on the problem server.

Any suggestions welcome...any one a Citrix guru??

Thanks-
