Hi Coraleigh,

Thank you for responding but if I am not mistaken if you install or have installed 913446 that updated supersedes security update 893066. I have 913446 installed on all my servers already.

I verified that which is way I added the sub note to let people know that I checked this information.

If I am wrong then please correct me. I will check the version number on the TCP stack to see if it's that version or newer which I also assume will be as good.

I was hoping that somebody out there can read this error and the code that goes with it and perhaps it points to a Mac address or something like that. Is there a cheap way of sniffing around the network just to get an idea to see if I am getting any of these errors listed in 898060?

Thanks  
Adam Raff

Hi Adam,

Some people have found that the Event ID you have is resolved by this Microsoft article... <http://support.microsoft.com/kb/898060/>

Sorry a little more info on this problem

We are running a Windows 2003 SP1 network. Desktops are all windows XP SP2. With all updated security patches on server and desktop side.

Re: Event SRV error 2012

I have also looked into KB913446 MS06-007 as this may lead to issues with connectivity. All my servers have this update as well as a new one that is also getting the errors as well.

Thanks  
Adam Raff

Good Day,

Over the few months we have been having an ongoing issue with the following error messages and they appear on all of our servers.

Event Type: Warning  
Event Source: Srv  
Event Category: None  
Event ID: 2012  
Date: 8/17/2007  
Time: 2:18:26 AM  
User: N/A  
Computer: HSMMAIN

Description:

While transmitting or receiving data, the server encountered a network error. Occasional errors are expected, but large amounts of these indicate a possible error in your network configuration.

The error status code is contained within the returned data (formatted as Words) and may point you towards the problem.

For more information, see Help and Support Center at <http://go.microsoft.com/fwlink/events.asp>.

Data:

0000: 00040000 00540001 00000000 800007dc  
0010: 00000000 c0000184 00000000 00000000  
0020: 00000000 00000000 0000097a

I have looked at this from so many ways but I can not find the point of the error. You see the problem goes away on weekends. We pretty much

Re: Event SRV error 2012

turn off all desktops but all servers and printer (network connected) and switches stay on. I thought that it was a desktop and checked over all the desktops and identified some that may have bad Nics. After fixing them I am still getting errors but again they disappear over the weekend.

The error message says to look in the error code which may point me in the right direction but I can not make heads or tails out to the error message. If somebody knows how to read this and point me in the right direction it would be a great help.

Thank You  
Adam Raff
