Hi Neil,

Every bit of info helps, what are the event ids? Also have you already looked them up at eventid.net?

Do you happen to remember what patches they were back in October? Is this Server 2003 Sp2? Are you also unable to connect to the server via computer management?

Hi,

I applied couple of critical patches from April till now as the previous admins did not install any of these patches. But, one of my domain controller (which holds the Global Catalog) was rebooted after the patch install. Reboot command got issued, but it did not time out when I tried pinging with a -t for almost 30 minutes. So, I thought something is wrong. I tried RDP in again and could not.

I have noticed this RDP problem cropping up from sometime in October of last year, when I applied patches and after that I could not RDP onto the server. I will have to reboot the server twice to get in through RDP again. Well this is not my main concern, but my main concern is the above problem. I am not physically at the site to look at the server what is going on with my Domain Controller, which I might go in tomorrow to work or on Monday morning if nobody calls in with login issues, I might reboot the server again.

Re: MS Critical Patches – Reboot – Did not reboot.

If anybody could let me know why all the domain controllers rebooted and this one did not. I have couple of event logs which I can throw it in here,
if needed.
