Summary/Goal:

I am wanting to change IP Addresses on 4 of my 10 servers to get them on the same segment. This is to simplify my DR Plan as my MS Environment is recovered at a different 'hot-site' than my Novell environment. My final goal is to get all Novell Servers on a Segment and MS Servers on separate Segment.

Environment:

I run DNS/DHCP via my Novell products. I know that I will have to change the DNS entries there and I will have to work with my development group for any 'hard coded' IP Addresses in other applications.

Other than going to the connection, IP information, and changing there, what else or where else might I need to change.

Thanks in advance to any information.

If you have WINS servers installed on your network you might need to tombstone the old records; and you might need to change DHCP options related to WINS as well as DNS. In addition you will need to reconfigure the default gateway settings on the servers after they've been moved.
