OK, So I used copy \\share\sharename\appname* c:\startmenu\appname and it worked. But robocopy didn't. Odd.

Something to bear in mind.

"Trinity Catholic High School" wrote:

Strange. I granted permissions (both security and sharing) to domain computers, and to a specific test machine's account, and I'm still getting the same 1314 error. its creating a directory structure, but not creating any files on the local machine.

Basically, I'm trying to create a computer specific startmenu, for our users, rather than user specific. I thought to do it, by copying a startmenu from a server (so it can be updated without visiting each machine), to the local machine, and setting in the group policy the local path for the startmenu redirection (which would be the same on every computer in the domain).

However, this doesn't seem to be working. Can anyone think of a different way to do this? (Other than forgetting the whole not visiting every machine...)

Thanks for all your input so far!

William Mann

Hi,

I'm using a startup script to copy a folder with a startmenu from a server to a local machine. I've been using robocopy, and its creating the folder structure but not the links. What am I doing wrong? The weird thing is, when I run the script from the command-line when logged in it works correctly, therefore I'm thinking its a permission problem. I tried granting everyone read-only permissions, but it didn't solve the issue.

The command I'm using:
robocopy /e /zb /copyall /XO
\\thssvr01\startmenu\$\1015vlaptop
c:\startmenu

Any ideas, Anyone?

Thanks.

Modify the command like so, then examine the log file c:\log.txt.

```
robocopy /e /zb /copyall /XO
```

Re: Startup Scripts

```
\\thssvr01\startmenu$\1015vlaptop  
c:\startmenu  
1>c:\log.txt 2>&1
```

I also recommend that you add a switch to prevent existing and unchanged files from getting copied each time.

Hi,

Its created a log of what its been trying to do, and is coming up with
ERROR
1314 (0x00000522) Copying NTFS Security to Destination Directory
\\server\foo
A required privilege is not held by the client. Is this an issue with
authentication against the server by the startup script?

Many Thanks,

William Mann

The Startup script runs before there is a user. The script has "System" privileges on the local computer, so it can do lots of things locally. The script uses the credentials of the computer object elsewhere in the domain. If there is a permissions problem, the permissions need to be granted to the computer object. I grant permissions to "Domain Computers" in these cases.
