A number of times during the day the IUSR\_ account locks itself.

I'm pretty sure it is related to the password policy that we propagated throughout the domain, requiring password complexity and expiration after 90 days.

The day after we applied this policy, Outlook Web Access stopped running and I found, after some searching, that IUSR\_ was locked out.

Can I just reset that password to whatever I like as long as it matches the password in the Default Site in IIS?

Thanks,  
JM
