Hello Pascal,

If you create a domain user account with the same settings like the other, i would say it is not the user account itself having problems. Did you use userprofiles stored on the server? Is the user working on a terminal server or on a local workstation that is domain member?

Best regards

Meinolf Weber

Hi all,

Here is a brief description of my problem. Every once in a while (like once every 3-4 months) I have a very strange problem. One of my user (I have 900 of them) is unable to map network drive via my login script or map the printer who are host on the same server. The weird thing is that my login script do not only map resources from this server. And every other map drive are mapped without problems.

I do not have any lead on the event log of the client computer, the server who doesn't share his resources or the DC.

I first thought it might be a SID problem cause if I copy the user from the AD and recreate it with the same login and group membership everything is working fine. The problem with that solution is that i have to copy EVERYTHING he had in his profile on each computer he was using.

If you guys have ANY lead it would be very appreciated !!!

Pascal
