I've setup a few servers but not experienced this before. Any ideas. I am installing server 2003 standard on a computer that has a 130 gig hd, 2.4 Celeron, 512 meg memory. After the CD loads into memory, and after it loads all the setup files into ram, it says "Setup is starting Windows", only it never does. It just stays there. What could I be over looking. I had been running server 2000 on this machine for a little while and wanted to put 2003 on it. The new HD seems to be fine. As a thought, I let the 2000 version partition and format the new drive with NTFS, and it did it just fine, so I doubt it is the HD. Docs say I only need 128 memory, but I've got 512.

Terry
