I'm running Windows Server 2003 SBS and trying to export an SSL certificate of a web site. I go into the MMC, add the Certificates snap-in, select Computer Account, Local Computer, and expand the Personal Certificates. After selecting the appropriate certificate, choosing export, it does not give me the option to click, "Yes, export the private key." It is my understanding that this will happen if the key has already been exported.

Therefore, it should work if I requested a new certificate for the site. I then open the IIS manager, navigate to the web site, and choose Server Certificate under Directory Security. My options are to either renew, remove, or replace the current certificate. What exactly should I do? Am I heading in the correct direction? Any assistance would be greatly appreciated.

Thanks,
Aaron
