I currently have a PC that hosts my HP OfficeJet 5510 multi-function device under WinXP Pro. I am about to upgrade the motherboard on this PC and have a requirement to run Win2k3 on this upgraded box. However, I am aware that the OJ5510 is NOT supported under win2k3.

My question is how do I connect the printer to this PC? Is it feasible to install Virtual PC and then WinXP to run within Win2k3? Or should I install Virtual Server 2k5 to host WinXp?

I definitely need to have Win2k3 as the main OS on this rebuilt PC, but also need the OfficeJet not just to print, but to scan and fax.
