Hello Walter P.,

If policies are not applied correctly, it can have problems with DNS, so please post an ipconfig /all from one problem machine and the DC?DNS server of your domain.

Best regards

Meinolf Weber

Hello Walter P.,

Should a normal domain user add the computer to the domain? Or do you add them to the domain yourself and the users can not login with their user account?

Best regards

Hi all,

I have a Win 2003 Server, with about 50 PCs (XP Pro SP2) into the domain. My problem is when I try to add a couple of PCs to the domain.

Re: Problems to add PCs to domain

I normally add them thru My Computer – Computer Name –  
Change –  
Member Of... reboot.

There, there is no problem, but when a user logs in, with his  
domain

user, you can see that the GPOs are not applied, and that the  
PC

cannot "see" the domain (for instance, to assign rights to  
domain  
users)

Nevertheless, the PC appears in the Computers OU and its  
full name

includes the domain...

I have tried to re-add the PC several times, deleting the PC  
account

from the AD, but it is the same.

Any ideas?

Thanks!

Hi Ppl!

To reply to your questions:

1: We are using static IPs

2: The Admin user is the only that manages users and computers,  
therefore, only with that user we add, modify and delete computer and  
user accounts

Thanks to all

W.
