You may want to create a group policy to restrict users to access C drive and create home directory for each user.

How to use group Policy to hide a hard drive
With Group Policy Objects in Windows, there is a "Hide these specified drives in My Computer" option that lets you hide specific drives. ...

Hello,

I need some help. I'm trying to quickly setup a server that will allow users to login remotely using Remote Desktop connection. I can't use Terminal Services. Within the C drive, I want to create a folder for Remote Desktop users. Within that folder I want to create individual user folders for each user that logs into the server. I want each remote user to be able to access ONLY their user folder and NOTHING else. Sure they should have access to their individual user profile folders under documents and settings, but other than that, they should only browse to the user folder. I don't even want to allow them to browse the C drive. I was thinking of creating a shortcut in their desktop to point directly to their folder. What's the best way to accomplish this? Any help would be appreciated.

Thanks,
Edward
