Hello nevets2001uk,

On which way are the files created to the folders, via script? Then please post the script content.

Best regards

Meinolf Weber

I'm having a very annoying issue with Permissions on a server recently added to our domain.

We have some software that generates PDF files sent from an old Alpha system. It creates the files in any of 10 directories depending on the document type. It runs as a Local System service and has been working fine until now.

Recently the files it creates have not been inheriting permissions from the parent folder. They get Administrator and System Full Control only. We have three groups (1 local, 2 domain) and non of these are given the proper access to newly created files.

If I manually create a new file in the directory it inherits the permissions as expected. If I do the replace permissions on all child object from the parent folder the files all get the appropriate permissions.

It just seems that they don't get them when they are first created.

I've tried so many things, from removing the permissions and re-adding them, to turning inheritance off and then on to even deleting the folders, re creating them and applying the permissions and share access from scratch. Always with the same result.

Any thoughts and ideas would be much appreciated. My heads hurting

Re: Permissions Issue

from banging the wall so many times!!
