For information and enlightenment:

I fixed the problem, it turned out to be a winsock corruption.

reinstalling tcp was the answer.

"Alan C" <nospam@xxxxxxxx> wrote in message news:uq4O1rAEJHA.1460@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

One XPPro workstn was infected by the antivirus 2008 trojan, which I have managed to clean.

One problem remains: I cannot browse any server (2003) shares via network places or explorer, although all mapped drives are accessible.

When I try to browse to the server, - "\\our_srv\" only one share is shown - 'userdata' - and this appears as an empty folder.

I know that the trojan affects the local policies, which I've reset, but cannot find anything that would cause the above.

Any help, suggestions, guidance would be gratefully received.

P.S. I'm not sure if this is the correct ng. Hope it is.
