Our setup is \\Servername\Hiddenshare\$\userdir
The Share permissions on the hidden share are
Domain Admins Full --Allow
Domain Users Read, Change -- allow

Security ACL for hidden share is
Domain Admins, Full - Allow, This folder & subfolders &
files
Owner , Special (All checked) Allow, Subfolders & files
only
Domain Users, Read & Execute Allow, This folder Only
System ,Full Allow, This folder & subfolders & files

UserDir folder is
Domain Admins, Full - Allow, This folder & subfolders &
files
Username, Full - Allow, This folder & subfolders & files
Owner , Special (All checked) Allow, Subfolders & files
only
System ,Full Allow, This folder & subfolders & files

Is this all your looking for?
Thanks for looking at this!
I will so some more testing.

Try as a test putting a copy of the MDB file in a folder with Everyone=Full
Control for the share perms. For the NTFS permissions, Administrators &
System = Full Control, Users = Modify. See what happens.

Hi All,
We are using Access 2003 from a Windows XP Pro workstation accessing Databases on a Windows 2003 Sever. When a database is opened an .LDB file is created. This file is created to lock the database and keep other users from accessing it when someone is already using it. When Access is closed this file should automatically disappear. In my case it does not auto-delete. A domain Admin can not delete this file. It has no security tab on it. Access is not exiting improperly or anything like that. I have reproduced this on some other 2003 servers in our domain, but on others it work correctly. That is the .LDB file auto-deletes and has a security tab. So it does not seem to be a MS Access issue but a Server issue. No other files to my knowledge are missing the security Tab. Has anyone seen this? Have thoughts? Thanks in advance.
Dave

Re: .LDB file has no security tab

Re: .LDB file has no security tab

What are the NTFS permissions on the parent folder where the .mdb file lives?

More info&

When I open a database and check the properties of the locked LDB file. I have the following tabs; General, Security, Summary, and Previous versions.

When Access is closed all tabs but the general tab are gone.

After adding system full and giving domain users read & change to share level permission I still have no Security tab when access is closed but I now do have the Previous versions tab which I did not have before.

Next test

I have changed domain users from read & change to Full and gave everyone full to share level permissions. Same thing, no security tab just Prev versions tab & still can not delete LDB file.

Next text

Gave everyone Full permissions one Share, & folder levels. No security tab & can not delete.

More info...

the locked .LDB files that have no security tab also..
are not seen by the FileSystemObject – Using VBscript
but can be listed by the DIR command
