Steven,

I have read this article and it is an excellent reference, but in my case there is something missing.

When you get to step 5 in that article it shows you how to set up 1 local users to be authenticated.

I need all of my users to authenticate.

I do not think this is a Cisco question at all.

I can configure my pix to authenticate to a RADIUS server with out a problem. (If I did have a problem with that, then yes it would be a cisco question).

The problem is I don't want one local user to authenticate, I need all of my remote VPN users to authenticate.

On windows NT 4.0 RADIUS, all I had to do was click on the "User Authentication" tab and select "Windows NT Authentication" as my current default authentication provider.

How do I do this with windows 2003 IAS server?

Thank you.
