>

> *1. How did you "introduce" the Windows Server 2003 into your Domain? Did you run In-place upgrade or migration?*

I have 1 Forest with 1 Domain and 2 sites each with 1 DC (win2k) both are GC's and 1 of the DC's holds all of the FSMO roles. I ran adprep /forest then adprep /domain. Then i DCPROMO'd a win2k3 member server. All DC's are replicating fine.

> *2. What changes were made in your domain after you upgrade your domain?*

None. The win2k DC still has the all of the FSMO roles and is a GC. The win2k3 DC is not a GC.

> *3. Which version of operating system are the clients using? Is it Windows 98? It is different to run the scripts on different operating systems.*

All of my clients are win2k and winXP

> *4. Is your script for user or for computer?*

The logon script that i am talking about is defined in the User's Account Properties in Active Directory Users and Computers. It is not a script defined and applied via a GPO.

> *5. Did you try to logon using different computers and different users?*

Yes. This only happens to some users some of the time.

> *I have suggestions for you:*

Thanks – i'll look into these.
