I have a problem,

After performing a user and group migration between an NT4 Domain to a new 2K3 Domain this morning I now find the Administrator is no longer allowed access to all of the event logs except security!.

Everthing seemed to go fine all 1800 user accounts came across with passwords without a hitch

I had prepared a secondary Admin account beforehand that did not exist in the source domain this works fine and has access to all of the event logs.

What could have gone wrong? How can I re-instate the administrators account with all of the correct permissions?

TIA

Geoff Hall
