While most people are upgrading to 2003, we're tasked with also moving people to a new domain (was previously just a single domain forest).

My question arises from security.

As JOEUSER gets processed thru the ADMT meat packing plant, out comes a sausage with a new SID and also a SIDhistory so they can access old resources across this bi-directional trust we've established for the domains.

So when the old 2000 Domain-1 goes away and there is only the new 2003 Domain-2 left, what comes of the old security? Especially on people with, say, laptops that have to access local stuff? Does the SIDhistory go away? And if it does, will they still be able to access everything?

Just concerned since most people do this kind of thing one piece at a time, not simultaneously. The brass want people logging onto this "new domain" as soon as possible. Gotta love company politics.

Thanks,
Gary Heller
