bit more background..

The person before me on the project migrated groups from a NT4 and W2K domain, and the groups had exactly the same name !! Therefore two groups are showing with the same RID in the database.

When I migrated groups I now pre-fix them with the old source name so we don't have the same issue.

Also, they tried to merge SID by migrating the W2K account..then renaming it to the NT4 account name..and migarting the NT4 account over the top..they seemed to think this would work..but I have my doubts.

As I posted..I have tried all this with fresh groups..still didn't work. This is why I'm wondering if the database has somehow become confused due to the duplicate names. The question is how to fix it, without impacting the already migrated user accounts.
