We just upgraded our DCs from w2k to w3k. My workstation is XP Pro sp2 and I am running the "Group Policy Management Consoel w/sp1. Everything was working fine until after the Windows upgrade. Now I receive the following msg. when I click on a GPO object:

"The Enterprise Domain Controllers group does not have read access to this GPO. The Enterprise Domain Controllers group must have read access on all GPOs in the domain in order for Group Policy Modeling to function properly."

Any ideas? Thanks for any and all help.

Clayton
