I have tried the solution: Disable the following settings:

Microsoft network server: Digitally sign communications (always)

Microsoft network client: Digitally sign communications (always)

I am still having a big problem. As it sits now, users from the other two NT4 Domains can use the find/search for computers to get to any computer in my 2003 domain EXCEPT the new Win2003 Server itself!! The major problem with this is that this is my new File Server, and All project documents were moved over to this box a couple of weeks ago. I suspect that there are some "default" Win2003 Server/AD security settings that are blocking access to the users from the other NT4 Domains. Can anyone help with this?

.
