- 

I should have been more specify – sorry

- 1) I ran adprep/forestprep & domain prep on windows 2000 server
- 2) I added a windpows 2003 server to the domain
- 3) I loaded Active directory to the 2003 server and made it a second DC

Users are not getting error message – it now just say the "live" network cable they used to attach to the network no longer is functional. All servers are operational. And I can log onto them & print from them etc. But all users cannot attach to the network via their network cables????

I am completely baffled ...

- >
- > The schema and infrastructure operations masters are used to introduce forest and domain-wide schema changes to the forest and its domains that are made by the Windows Server 2003 adprep utility. Verify that the domain controller that hosts the schema role and infrastructure role for each domain in the forest reside on live domain controllers and that each role owner has performed inbound replication over all partitions since they were last restarted.
- >
- > Verify that the schema master and each infrastructure master have performed inbound replication of Active Directory since last booted. Inbound replication can be verified by using the REPADMIN /SHOWREPS DCNAME command, where DCNAME is the NetBIOS computer name or the fully qualified computer name of a domain controller.
