Hi there,

We would like to migrate from an NDS file sharing environment to Windows 2003. The W2K3 user accounts exist but not the AD security groups. The AD accounts were there to authenticate MS mailboxes. So, with the AD accounts already in existence, how can we duplicate the security groups (lower priority) and migrate the NDS data structure to Windows and map the equivalent file permissions in AD? I have been reading some information on ADMT and FMU but what would be the best for mapping the permissions correctly on the Windows side?

Thanks in advance for any info.

.
