Hello,

We currently have a NT 4 acting as a DHCP server and recently setup a new machine for the DHCP. It was authorized ok but the clients can't seem to get any IPs. The New server is using a new IP address in the same subnet.

Yes, the old server has the DHCP services stop and data imported into Win2K3 according to the KB article (migrating NT4 DHCP to Win2K3)

Any ideas?

thanks

.
