Hello,

I did the server migration. And now I am working on the workstation migration. An user, User\_A has the Domain User right on the Domain Controller. It's the same as he has a Domain User right in NT4.

I use my Administrator account and help user\_A to copy all his profile from his old profile to his new profile, so User\_A can get back all his desktop setting as he used before. (I use System Properties | User Profiles | "Copy to" and copy the profile. Not in Windows Explorer, copy and paste)

Unfortunately, when User\_A logon with his account. He is unable to see his original wallpaper. Even he is unable to change wallpaper. He is a Domain User who under an OU, not Domain root. He is also an Administrator at the workstation. Is there anyone knows why? Thanks!!

On the other hand, is there anyone knows how to map a network printer from the logon script? I tried net use ltp1: \\servername\printername , but it doesn;t work! Shall I use con2prt.exe as well? Is this the only way? Thanks!

.
