Jason –

Thanks for the reply –

we are changing the "DefaultDomainName" in Winlogon reg key – our script runs prior to ADMT migrating the workstation. Windows 2000 correctly shows the new domain, Windows XP does not. We are going to test the CachePrimaryDomain change this morning, i will let you know.

Putting this in the logon script does not really help us, because the users cannot log in locally (they only have domain accounts), and most do not know which domain they even log into.

Thanks,  
Jmhop

Hello,

Thanks for posting!

ADMT cannot change the default logon domain of the workstations. I suggest you write a script to change the default log on domain according to the following methods:

To change the default Log on to: value edit the following local registry key of the machine you are logging on to:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon

CachePrimaryDomain

You may write a domain logon script to achieve the goal.

More information for your reference:
