Hello All & Greetings.

I want to migrate a single server box running WIndows NT 4SP6a to WIndows Server 2003 SP1.

1. The old box is running NT4, is a PDC. There are no BDCs. Only a Member Server running SQL Server. The old Member server will continue to run SQL Server – for now.
2. There's already the new box running WIndows Server 2003 SP1. No AD, DNS / WINS configured – yet.

I am looking for step-by-step Instructions to do this successfully. Most Whitepapers, articles, etc arwe about doing this when migrating form NT4 to W2K3 on the same box.

Any help / links will be appreciated. Please reply to:  
cansciences@xxxxxxxxxx

Thanks,

kishan
