Hello,

Thank you for your reply!

Actually the trust relationship is not a must. It is just for test purpose. Based on my test all work fine on my side. I can access the share on a domain controller from workstations from another domain. The issue seems weird to me. At this point I suggest you verify if you have any firewall client/AV applications installed. If so, please uninstall them temporarily and check the issue. If not, I suggest you enable and apply security auditing in Windows 2000. You can configure the security logs to record information about either directory and file access or server events. You may refer to the following article for detailed information.

How to enable and apply security auditing in Windows 2000
<<http://support.microsoft.com/default.aspx?scid=kb;EN-US:300549>>

Please reproduce the issue and check the related event log after security auditing is enabled. You may post back the event and I am glad to be of assistance!

Hope the information helps. If there is anything that is unclear, please feel free to let me know.

Best Regards,

Jason Tan

| Thank you Jason for your special support.
| It's all clear.

- | 1. It gives the same resoult...no access, continuous prompt for user and password
- | 2. It gives the same resoult...no access, continuous prompt for user and password
- | £. I'm tring to espablish a trust....it's the best thing I know, but I'm not the administrator of the other domain
