Hi,

Please modify the registry at client side.

Thanks.

Best regards,

Vincent Xu

Is this registry setting on the DC or on the workstation?

--Nick

"Vincent Xu [MSFT]" wrote:

Hi Nick,

There're many reasons that will cause the symptoms. For example, the

name

of the domain member was changed recently; the computer account in DC

was

removed unexpectedly; or, some 3rd party applications may cause the

secure

channel broken, and so on.

Rejoin the problematic box into domain should be the most effective

way.

RE: NT to 2003 Upgrade problems

However, we still have following method can have a try:

Modify the following entries and setting them to 0:

[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Netlogon\Parameters]

"requiresignorseal"
"sealsecurechannel"
"signsecurechannel"

If the problem still occurs,

1. Enable logon failue audit on DC
2. Try to logon
3. Save system event log on client and Save Security event log on DC
4. Compress the two logs into one zip file and attache it in reply

I recently upgraded a
Windows NT PDC to 2003
Active Directory. After

the

upgrade I could no longer
log in to several servers in
the domain. I
received the following

RE: NT to 2003 Upgrade problems

RE: NT to 2003 Upgrade problems

message:

Windows cannot connect to
the domain, either because
the domain

controller

is down or otherwise
unavailable, or because your
computer account

was

not

found. Please try again later.
If this message continues to
appear,

contact

your system administrator.

I have checked and the
computer accounts for these
servers exist in

the

new

domain controller.

Is there anything other than
rebooting and/or re-adding
these servers

to

the

domain that will fix this
problem?
