Hi,

Based on my knowledge, the steps can be:

1. Install a new printer server
2. Using same IP address, computer name and printer share name for the new printer server.
3. take the previous printer server offline
4. Join the new printer server into domain
5. Grant corresponding permissions to printer users.

The failed cause can be various. I'd like to suggest you check the registry key at :

HKEY_CURRENT_USER\Printers\Connections\

to see if the connection is properly set.

Best regards,

Vincent Xu

Hi, we had a number of printers installed onto a Win2K Server DC acting
as a

printer server besides other network services. IP addr was x.x.x.100. I
then proceed to setup a W2K3 R2 Server, renamed it to the same name as
the

Win2K server after taking the old server down. Changed the IP addr back
to

its original as x.x.x.100. So the printers shared name is the same as
before. However, the clients' machine do not recognize these printers
anymore. It indicated as "Printer not found" in their Printers and Faxes
properties. All I had to do was remove these printers and resetup. Just
wondering why wouldn't the printers continue to work because the printers
share name and server IP addr is the same as before.
